Covid-19 Vaccine Residual Analysis (C19VRA) case reviews

Between late 2024 and Summer of 2025, a total of 35 people chose to have a Covid-19 Vaccine Residual (C19VRA) performed. Although multiple markers were in the analysis, the results were the same across the board for all markers. Colors of 'Green' for those who do not have the synthetic mRNA, 'Yellow' for those who do have the synthetic mRNA from transmission and 'Red' for those who have the synthetic mRNA from injection.

Of those 35, seven individuals were excluded from moving into the treatment phase because they were 'Green'. If the synthetic mRNA is not in the system, treatment should not be done. Nineteen of the remaining individuals chose to move forward with treatment. The remaining nine individuals chose not proceed with treatment.

Following 3 months of treatment, all 19 individuals, when their blood went through analysis again, were found to go from either 'Yellow' or 'Red' to 'Green' on all markers.

A handwritten signature in black ink, appearing to read 'Nathan Petersburg', with 'ND, FNMI' written in smaller letters below it.
